

DESCRIPTION

The HY6116A is a high-speed, low power and 2,048 x 8-bits CMOS static RAM fabricated using Hyundai's high performance twin tub CMOS process technology. This high reliability process coupled with innovative circuit design techniques, yields maximum access time of 85ns. The HY6116A has a data retention mode that guarantees data to remain valid at a minimum power supply voltage of 2.0 volt. Using CMOS technology, supply voltages from 2.0 to 5.5 volt have little effect on supply current in data retention mode. Reducing the supply voltage to minimize current drain is unnecessary with the HY6116A Series.

FEATURES

- High speed-85/100/120/150ns (max.)
- Low power consumption
 - Operating : 150 mW (typ.)
 - Standby (CMOS) : 0.5 μ W (typ.)
- Single 5V \pm 10% power supply
- Battery backup (L-part)
 - 2.0V (min.) data retention
- Fully static operation
 - No clock or refresh required
- TTL compatible inputs and outputs
- Tri-state output
- Standard pin configuration
 - 24 pin 600 mil PDIP

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

| SYMBOL | PARAMETER | RATING | UNIT |
|----------------|------------------------------------|--------------|---------|
| VCC, VIN, VOUT | Power Supply, Input/Output Voltage | - 0.5 to 7.0 | V |
| TA | Operating Temperature | 0 to 70 | °C |
| TBIAS | Temperature under Bias | - 10 to 125 | °C |
| TSTG | Storage Temperature | - 65 to 150 | °C |
| Pd | Power Dissipation | 1.0 | W |
| IOUT | Data Output Current | 50 | mA |
| TSOLDER | Lead Soldering Temperature & Time | 260•10 | °C •sec |

Note :

1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational of this specification is not implied. Exposure to absolute maximum rating conditions for extended period may affect reliability.

TIMING DIAGRAM

READ CYCLE 1

Note (READ CYCLE):

1. tCHZ and tOH are defined as the time at which the outputs achieve the open circuit conditions and are not referenced to output voltage levels.
2. At any given temperature and voltage condition, tCHZ max. is less than tCLZ min. both for a given device and from device to device.
3. WE is high for read cycle.

READ CYCLE 2

Note(READ CYCLE):

1. WE is high for read cycle.
2. Device is continuously selected CS= VIL.
3. OE= VIL.

WRITE CYCLE 1 (OE Clocked)

WRITE CYCLE 2 (OE Low Fixed)

Note (WRITE CYCLE):

1. A write occurs during the overlap of a low \overline{CS} and a low \overline{WE} . A write begins at the latest transition among \overline{CS} going low, and \overline{WE} going low: A write ends at the earliest transition among \overline{CS} going high and \overline{WE} going high. t_{WP} is measured from the beginning of write to the end of write.
2. t_{CW} is measured from the later of \overline{CS} going low to end of write.
3. t_{AS} is measured from the address valid to the beginning of write.
4. t_{WR} is measured from the end of write to the address change. t_{WR} applied in case a write ends as \overline{CS} or \overline{WE} going high.
5. If \overline{OE} and \overline{WE} are in the read mode during this period, the I/O pins are in the output low-Z state, inputs of opposite phase of the output must not be applied because bus contention can occur.
6. If \overline{CS} goes low simultaneously with \overline{WE} going low or after \overline{WE} going low, the outputs remain in high impedance state.
7. D_{OUT} is the same phase of lastest written data in this write cycle.
8. D_{OUT} is the read data of the new address.

DATA RETENTION CHARACTERISTICS
